FIBER OPTICS TECHNICIAN – INSIDE PLANT (FOT-ISP)
Competency Requirements

This competency listing is the syllabus or objective of each individual subject item in which a Fiber Optics Technician – Inside Plant (FOT-ISP) must be knowledgeable and skilled to prepare for the hands-on course training and the ETA® International FOT-ISP certification knowledge examination. The competency includes concepts and techniques of installing, servicing, troubleshooting, splicing, testing and repairing fiber optic transmission cable, connection devices, links and spans; diagnostically ranging from the intermediate installation for Enterprise Networks, LANs and Data Centers up to rudimentary project aspects.

A FOT-ISP technician, in addition to completing a special course, fee and hands-on skills exam from an ETA approved school must also be knowledgeable in the following technical areas:

1.0 BASIC PRINCIPLES OF LIGHT

- 1.1 Describe the Electromagnetic Spectrum and locate light frequencies within the spectrum in relation to communications frequencies
- 1.2 Describe how the Index of Refraction is calculated
- 1.3 Describe the phenomenon of total internal reflection (TIR) that makes fiber optic transmission possible
- 1.4 Define Fresnel Reflection Loss
- 1.5 Explain the effects of refraction
  - 1.5.1 Explain Snell's Law

2.0 PRINCIPLES OF FIBER OPTIC TRANSMISSION

- 2.1 Describe the basic parts of a fiber optic link
- 2.2 Describe the basic operation of a transmitter
- 2.3 Describe the basic operation of a receiver
- 2.4 List the benefits of Multiplexing optical signals
- 2.5 Explain the purpose of decibels (dB)
  - 2.5.1 Explain how to express gain, loss and reflectance using dB
- 2.6 Explain how Optical Power is measured (dBm)
  - 2.6.1 Express optical power levels in dBm's
  - 2.6.2 Compare power gains and losses
  - 2.6.3 Identify common wavelengths used in multimode systems
  - 2.6.4 Identify common wavelengths used in single-mode systems
  - 2.6.5 Explain the relationship between dBm and Watts

3.0 OPTICAL FIBER CONSTRUCTION AND THEORY

- 3.1 Name the materials out of which optical fiber core is manufactured
- 3.2 Discuss why the core and the cladding have different compositions of glass
- 3.3 State the materials from which the fiber optic coating is manufactured
- 3.4 Define the performance of optical fibers used in the telecommunications industry in accordance with Telecommunications Industry Association (TIA®), Telcordia, International Electrotechnical Committee (IEC) and the International Telecommunications Union (ITU®)
- 3.5 Summarize the fiber types that correspond to the referenced fiber designations OM1, OM2, OM3, OM4, OM5, OS1, and OS2 in accordance with ISO/IEC (the International Organization for Standardization/International Electrotechnical Commission) requirements
  - 3.5.1 Explain the various attenuation values of OM 1, 2, 3, 4 &5 multimode and OS 1 & 2 single-mode fiber types
- 3.6 Describe single-mode fiber and how it differs from multimode fiber
  - 3.6.1 Explain why multimode fiber may be selected over single-mode fiber

- 3.6.2 Explain the difference between legacy multimode fibers and laser optimized multimode fibers
- 3.6.3 Describe the mode field diameter of a single-mode fiber and how it differs from the fiber's core

3.7 Describe the basics of optical fiber manufacturing

3.8 Point out how the number of potential paths (modes) of light is one of the most important characteristics used to distinguish types of fiber

3.9 Distinguish the relationship and purpose between the different refractive index profiles

4.0 OPTICAL FIBER CHARACTERISTICS

4.1 Define dispersion in an optical fiber

4.2 Explain how modal dispersion causes pulses to spread out as they travel along the fiber

- 4.2.1 List the methods for overcoming modal dispersion

4.3 Explain how material dispersion arises from the change in a material's refractive index with wavelength

4.4 Relate how waveguide dispersion is a separate effect from material dispersion, arising from the distribution of light between core and cladding

4.5 Explain chromatic dispersion in an optical fiber

4.6 Describe how to measure fiber optic link attenuation using the referenced methods specified by TIA-526-14-B for multimode and TIA-526-7 for single-mode fiber optic cables

4.7 Describe how microbends can affect the signal of an optical fiber

4.8 Describe how a macrobend affects the signal attenuation

4.9 Relate how light rays have to fall within a fiber's acceptance angle, measured by the numerical aperture (NA), in order to be guided into the core

4.10 Identify the cone of acceptance as used in optical fiber

4.11 List the ANSI/TIA-568-D.3, ISO/IEC 11801, and ITU Series G minimum overfilled modal bandwidth-length product (MHz·km) limitations for common multimode optical fiber and cable types

4.12 Differentiate between the attributes and tolerances for the two common types of single-mode optical fibers used inside data centers and local area networks as defined in the IEC 60793 & the ITU-T series G.652, G.657. ANSI/TIA-568, ANSI/TIA-758 and Telcordia standards

4.13 List the ANSI/TIA-568-C.3, ISO/IEC 11801, and ITU Series G minimum overfilled modal bandwidth-length product (MHz·km) limitations for common multimode optical fiber and cable types

5.0 SAFETY

5.1 Explain how to safely handle and dispose of fiber optic cable

- 5.1.1 Explain potential electrical hazards in a fiber optic environment
- 5.1.2 Describe typical work place hazards in the fiber optic environment
- 5.1.3 List different types of personal protective equipment and where they are used
- 5.1.4 Explain good work habits

5.2 List the safety classifications of fiber optic light sources as described by the FDA, ANSI (Z136.2), OSHA, and IEC (60825-2) fiber optic communication standards to prevent injuries from laser radiation

- 5.2.1 Describe where Class 1 Lasers are used
- 5.2.2 Describe where Class 2 Lasers are used

5.3 Explain the potential chemical hazards in the fiber optic environment and the purpose of the material safety data sheet (SDS)

6.0 FIBER OPTIC CABLES

- 6.1 Draw a cross-section of a fiber optic cable and explain the purposes of each segment
- 6.2 Distinguish between the two buffer type cables:
  - 6.2.1 Loose buffer (stranded versus central tube)
  - 6.2.2 Tight buffer (distribution versus breakout)
- 6.3 Identify the different types of strength members used to withstand tensile forces in an optical fiber cable
- 6.4 Compare the choice of jacket materials and how they play a crucial role in determining characteristics of a cable
- 6.5 List common material classifications for a fiber optic cable
- 6.6 Describe the following cable types:
  - 6.6.1 Simplex cordage
  - 6.6.2 Duplex cordage
  - 6.6.3 Distribution cable
  - 6.6.4 Breakout cable
  - 6.6.5 Armored cable
  - 6.6.6 Messenger cable
  - 6.6.7 Ribbon cable
  - 6.6.8 Stranded Loose Tube cable
  - 6.6.9 Central Loose Tube cable - Unitube
- 6.7 Explain what hybrid cables are and where they are ordinarily used in fiber optics in accordance with ANSI/TIA-568-D.1
- 6.8 Describe a composite cable, as defined by National Electrical Code (NEC®) Article 770.2
- 6.9 Distinguish the difference between a fanout kit (sometimes called a furcation kit) and a breakout kit
- 6.10 Explain how fibers can be blown through microducts instead of installing cables underground or in structures.
- 6.11 List the National Electrical Code (NEC®) optical fiber cable categories including:
  - 6.11.1 Abandoned optical fiber cable
  - 6.11.2 Nonconductive optical fiber cable
  - 6.11.3 Composite optical fiber cable
  - 6.11.4 Conductive optical fiber cable
- 6.12 Describe the NEC® listing requirements for:
  - 6.12.1 Optical fiber cables
  - 6.12.2 Optical fiber raceways
- 6.13 Explain where the TIA-598-C color code is used and how the colors are used to identify individual cables
- 6.14 Describe TIA-598-C premises cable jacket colors
- 6.15 Explain how cable markings are used to determine the length of a cable

7.0 TYPES OF SPLICING

- 7.1 **Mechanical Splicing**
  - 7.1.1 Explain the extrinsic factors that affect splice performance
  - 7.1.2 Summarize the correct fiber preparation scoring method using a cleaver
  - 7.1.3 Discuss the mechanical splice assembly process
  - 7.1.4 Explain performance characteristics of index matching gel used inside the mechanical splice and splice-on connectors
  - 7.1.5 Perform ANSI/TIA-568-D.0 (Annex E.8.3) Optical Time Domain Reflectometer (OTDR) insertion loss procedures for a reflective event mechanical splice

7.2 **Fusion Splicing**

- 7.2.1 Describe the advantages of fusion splicing over mechanical splicing
- 7.2.2 Summarize the correct fiber preparation scoring method using a cleaver
- 7.2.3 Discuss the fusion splice assembly process and splice protection
- 7.2.4 Explain the key fiber and splice routing in fiber optic splice trays
- 7.2.5 Explain the use of the Splice Closure including:
  - 7.2.5.1 Butt style splice closures
  - 7.2.5.2 In-line splice closures
  - 7.2.5.3 Environmental sealing
  - 7.2.5.4 Bonding to ground requirements and techniques
- 7.2.6 Explain ANSI/TIA-568-D.0 (Annex E.8.3) Optical Time Domain Reflectometer (OTDR) insertion loss procedures for a non-reflective fusion splice
- 7.2.7 Explain the locations of single-mode splices in outside plant (OSP) installations

8.0 CONNECTORS

- 8.1 Identify the wide variety of fiber optic connector types including:
  - 8.1.1 In-line ferrule based connectors
  - 8.1.2 plug/receptacle connectors
  - 8.1.3 multi-fiber connectors
- 8.2 Describe the most common approaches to align the fibers including:
  - 8.2.1 ferrule based connector
  - 8.2.2 V-groove assemblies for multiple fibers
- 8.3 Describe the ANSI/TIA-568-D.3 section 5.2.2.4 two types of array adapters
  - 8.3.1 Type-A MPO and MTP® adapters shall mate two array connectors with connector keys key-up to key-down
  - 8.3.2 Type-B MPO and MTP® adapters shall mate two array connectors with connector keys key-up to key-up
  - 8.3.3 Describe how the MPO 8/16 is prevented from cross mating with the standard MPO 12/24 fiber connectors
- 8.4 Identify the connectors specified in the ANSI/TIA 942- Infrastructure Standard for Data Centers
- 8.5 Describe ferrule materials used with fiber optics connectors
- 8.6 Explain both the intrinsic and extrinsic factors that affect connector performance
- 8.7 Define physical contact (PC), angled physical contact (APC), and ultra physical contact (UPC) finishes
  - 8.7.1 Explain how PC, APC, and UPC finishes affect both insertion loss and back reflectance
- 8.8 Explain how physical contact depends on connector endface geometry to include the Telcordia GR-326 three key parameters for optimal fiber contact:
  - 8.8.1 Radius of curvature
  - 8.8.2 Apex offset
  - 8.8.3 Fiber undercut and protrusion
- 8.9 Describe how and where pigtails are used in fiber cabling
- 8.10 Summarize connector termination methods and tools including:
  - 8.10.1 Thermal cure
  - 8.10.2 Anaerobic adhesive
  - 8.10.3 Splice-on mechanical connectors
  - 8.10.4 Fuse-on mechanical connectors
- 8.11 Compare the differences between field polishing, factory polishing, and no-epoxy/no-polish connector styles
- 8.12 Describe how to properly perform a connector endface cleaning and visual inspection in accordance with ANSI/TIA-455-57 Preparation and Examination of Optical Fiber Endface for Testing Purposes

8.13 Explain how to guarantee insertion loss and return loss performance in accordance with the IEC 61300-3-35 global common set of requirements for fiber optic connector endface quality
8.14 Identify both multimode and single-mode connector strain relief, connector plug body, and adapter housing following ANSI/TIA-568-D.3 section 5.2.3
8.15 Explain the importance of connectorization yield when installing an optical span

9.0 SOURCES

9.1 Describe the two primary types of light sources including the light emitting diode (LED) and semiconductor laser (also called a laser diode)
9.2 Explain the basic concept, operation and address launch conditions of a LED light source
9.3 Explain the basic concept and operation of a laser diode light source
9.4 List the differences between the Fabry-Perot (FP), distributed feedback (DFB), and vertical-cavity surface-emitting laser (VCSEL), commonly used in fiber optic communication systems
 9.4.1 Explain the impact of Fresnel reflections on Fabry-Perot and distributed feedback (DFB) lasers and their signal quality
9.5 Recall the typical operational wavelengths for communication systems
9.6 Compare the performance characteristics of the LED and laser light sources to include:
 9.6.1 Output pattern (sometimes referred to as spot size)
 9.6.2 Source spectral width
 9.6.3 Source output power
9.7 Identify standards and federal regulations that classify the light sources used in fiber optic transmitters
9.8 Explain the differences between an overfilled launch condition and a restricted mode launch (RML)
9.9 Explain Encircled Flux and when it should be used for testing multimode spans

10.0 DETECTORS AND RECEIVERS

10.1 Explain the use for PIN photodiodes and theory of operation
10.2 Describe the benefit of using an avalanche photodiode (APD)
10.3 Compare the factors in photodiode performance characteristics including:
 10.3.1 Responsivity
 10.3.2 Sensitivity
 10.3.3 Switching speed
10.4 Discuss how fiber optic receivers are typically packaged with the transmitter and how together, the receiver and transmitter form a transceiver
 10.4.1 Review an SFP module (small form-factor pluggable transceiver)
10.5 Examine a block diagram of a typical receiver that is divided into three subassemblies:
 10.5.1 Electrical subassembly
 10.5.2 Optical subassembly
 10.5.3 Receptacle
10.6 Describe the two key characteristics of a fiber optic receiver:
 10.6.1 Dynamic Range
 10.6.2 Wavelength

11.0 PASSIVE COMPONENTS AND MULTIPLEXERS

11.1 Discuss the different passive devices and the common parameters of each device:
 11.1.1 Optical fiber and connector types
 11.1.2 Insertion loss
 11.1.3 Return loss
11.2 Explain how optical splitters work

11.3 Explain that an optical attenuator is a passive device used to reduce an optical signal's power level

11.4 Explain how wavelength division multiplexing (WDM) combines different optical wavelengths from two or more optical fibers into just one optical fiber

11.4.1 Describe how the OM5 multimode fiber uses wavelength division multiplexing for increasing transmission data rates

11.5 Explain what short wavelength division multiplexing (SWDM) is and where it is used

11.6 Explain the difference between coarse wavelength division multiplexing (CWDM) and dense wavelength division multiplexing (DWDM)

11.7 Point out that an optical filter is a device that selectively permits transmission or blocks a range of wavelengths

12.0 PASSIVE OPTICAL NETWORKS (PON)

12.1 Define the passive and active individual optical network categories

12.2 Describe the technologies used in passive optical local area networks (POLANs)

12.3 Explain that the fiber to the X (FTTX) is used to describe any optical fiber network that links the end user directly to the service provider

12.4 Discuss the major inside plant components for a fiber to the X (FTTX) passive optical network (PON)

12.5 Explain the maximum span length of a passive optical local area network (POLAN)

12.6 Explain the types of single-mode fibers used in POLAN installations

13.0 CABLE INSTALLATION AND HARDWARE

13.1 Define the physical and tensile strength requirements for optical fiber cables recognized in ANSI/TIA-568-D.3, section 4.3 to include:

13.1.1 Inside plant cables

13.1.2 Indoor-outdoor cables

13.1.3 Outside plant cable

13.1.4 Drop cables

13.2 Compare the bend radius and pull strength tensile ratings of the four common optical fiber cables recognized in ANSI/TIA-568-D.3, section 4.3

13.3 Identify some the hardware commonly used in fiber optic installation to include:

13.3.1 Pulling grips, pulling tape and pulling eyes

13.3.2 Pull boxes

13.3.3 Splice enclosures

13.3.4 Patch panels

13.3.5 Indoor fiber distribution hubs

13.3.6 Multi user telecommunications outlet assembly (MUTOA)

13.4 Compare the variety of installation methods used to install a fiber optic cable such as:

13.4.1 Tray and duct

13.4.2 Conduit and microduct

13.4.3 Direct burial

13.4.4 Aerial

13.4.5 Blown optical fiber (BOF)

13.5 Describe the National Electrical Code (NEC®) Article 770 and Article 250 requirements on fiber optic cables and their installation within buildings to include:

13.5.1 Fire resistance

13.5.2 Grounding

13.5.3 Transition point between listed and unlisted cables

13.6 Discuss the documentation and labeling requirements in order to follow a consistent and easily readable format as described in ANSI/TIA-606- “Administration Standard for the Commercial Telecommunications Infrastructure”

13.7 Describe hardware management

13.8 Describe Top of Row (TOR) and End of Rack (EOR) specified in the ANSI/TIA 942- Infrastructure Standard for Data Centers

14.0 FIBER OPTIC SYSTEM CONSIDERATIONS

14.1 List the considerations for a basic fiber optic system design

14.2 Compare the different characteristic performance areas within a system of optical fiber and copper including:

- 14.2.1 Bandwidth
- 14.2.2 Attenuation
- 14.2.3 Electromagnetic immunity
- 14.2.4 Size
- 14.2.5 Weight
- 14.2.6 Security
- 14.2.7 Safety

14.3 Describe the performance of a multimode fiber optic link using the following sections of the ANSI/TIA-568-D.3 Optical Cabling Components Standard

- 14.3.1 Section 4.2 cable transmission performance
- 14.3.2 Section 5.3 optical fiber splice
- 14.3.3 Annex A (Normative) optical fiber connector performance specifications

14.4 Explain how to prepare a multimode optical link power budget as defined in IEEE 802.3

- 14.4.1 Calculate a multimode optical link power budget

14.5 Analyze the performance of a single-mode fiber optic link using the following sections of the ANSI/TIA-568-D.3 Optical Cabling Components Standard, ANSI/TIA-758 Customer–Owned Outside Plant Telecommunications Cabling Standard, and Telcordia GR-326 Core Generic Requirements for Single-mode Optical Connectors and Jumper Assemblies

- 14.5.1 ANSI/TIA-568-D.3 Section 4.2 cable transmission performance
- 14.5.2 ANSI/TIA-758 Section 6.3.4.1.2 attenuation
- 14.5.3 ANSI/TIA-568-D.3 Annex A (Normative) optical fiber connector performance specifications

14.6 Explain how to prepare a single-mode optical link power budget as defined in IEEE 802.3

- 14.6.1 Calculate a single-mode optical link power budget

15.0 TEST EQUIPMENT AND LINK/CABLE TESTING

15.1 Compare and contrast the functional use of the following pieces of test equipment:

- 15.1.1 Continuity tester
- 15.1.2 Visual fault locator (VFL)
- 15.1.3 Fiber optic light source (FOS) and fiber optic power meter (FOM)
- 15.1.4 Optical loss test set (OLTS)

15.2 Explain the proper use of the following pieces of test equipment:

- 15.2.1 Continuity tester
- 15.2.2 Visual fault locator (VFL)
- 15.2.3 Optical return loss test set (ORL)
- 15.2.4 Fiber optic light source (FOS) and fiber optic power meter (FOM)
- 15.2.5 Optical loss test set (OLTS)

15.3 Explain the role and types of tests performed in a TIA-568 Tier 1 test

15.4 Describe the importance the TIA-455 standard and it’s fiber optic test procedures (FOTP)

15.5 Compare the difference between an optical fiber patch cord and measurement quality test jumpers (MQJ)
15.6 Describe the use of a mandrel wrap or mode filter on both a multimode and single-mode source measurement quality reference jumper
  15.6.1 Describe the diameters of mandrel wraps for OM1, OM2 and OS2 fibers
15.7 Explain the ANSI/TIA-526-14- Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant procedures to include:
  15.7.1 Method A: Two Jumper Reference
  15.7.2 Method B: One Jumper Reference
  15.7.3 Method C: Three Jumper Reference
15.8 Describe the testing launch conditions of the following:
  15.8.1 Overfilled
  15.8.2 Restricted mode launch
  15.8.3 Encircled flux
15.9 Explain the role and types of tests performed in a TIA-568 tier 2 test
15.10 Describe the proper setup and cable preparation for an Optical Time Domain Reflectometer (OTDR) measurement including to:
  15.10.1 Measure fiber length
  15.10.2 Compensate the index of refraction to match the cable's sheath markings
  15.10.3 Evaluate connectors for attenuation and reflectance
  15.10.4 Evaluate splices for attenuation and reflectance
  15.10.5 Locate faults
  15.10.6 Rayleigh backscatter
  15.10.7 Identify Fresnel reflections
  15.10.8 Explain why a deadzone box is used to measure attenuation and reflectance on optical spans
  15.10.9 Describe the display of an OTDR's vertical and horizontal screens
  15.10.10 Identify the OTDR's signatures and causes for reflective, nonreflective, ghosts and roll-offs

16.0 TROUBLESHOOTING AND RESTORATION

16.1 Perform Fiber Optic Source (FOS) and Fiber Optic Meter (FOM) fiber optic link testing
16.2 Perform Fiber Optic Source (FOS) and Fiber Optic Meter (FOM) patch cable testing
16.3 Perform Optical Time Domain Reflectometer (OTDR) unit length testing:
  16.3.1 dB/km
  16.3.2 Wavelengths
  16.3.3 Bi-directional averaging of out of specification splices
16.4 Perform Optical Time Domain Reflectometer (OTDR) connector and splice evaluation
16.5 Perform Optical Time Domain Reflectometer (OTDR) fault location
16.6 Demonstrate and prepare acceptance testing documentation
16.7 Perform a not to exceed attenuation budget for a span of replacement fiber with a splice at each end

End of Fiber Optics Technician Competencies Listing:
(16 Major Knowledge Categories)
